At Batangas State University- Arasof Campus, campus administrators, maintenance personnel, and instructors often face difficulty tracking school assets such as classroom projectors, laboratory equipment, library furniture, and emergency light fixtures. Records are kept in separate spreadsheets and paper logs, so locating a faulty device or checking its maintenance history takes extra time. our team will develop a Campus Asset Mapping System to solve this: a digital interactive map that stores each asset's exact campus location, condition, and service notes. Authorized university staff can view asset details, flag broken equipment, and update repair status directly on the map.

SCENARIO

Instructor's experience: During a class, a teacher finds a faulty laboratory power supply. They open the mapping system, select the correct building-room location on the BatState-U campus map, mark the asset as defective, and submit a notification instead of filling-out a paper request form.

Maintenance staff's experience: Maintenance workers log-in to view all reported assets across different Batangas State-U buildings. They organize their inspection route, go to the marked location, and update the system once an item is fixed.

Campus Facilities Office staff's experience: Officers review the system's map-based records to identify buildings with many aging assets; they use this information to prepare equipment-replacement plans and budget proposals for the university.

A BatState-U laboratory technician needs to audit physics-lab equipment before the new semester. Using the Campus Asset Mapping System, they pull up the map of the science-building wing, view every registered oscilloscope and power supply's location and last-inspection date, mark missing items, and share the updated map record with the college dean instead of sorting through old-paper inventory lists.
